

Self-service for Apache Kafka

Get up and running with Kafka in no-time and start streaming quickly with Axual's all-in-one Kafka platform.

Axual offers an all-in-one Kafka platform that enables teams to get up and running with Kafka in no-time. It provides self-service capabilities on top of Kafka so teams can easily setup and manage data streams through an intuitive interface. Axual allows you to run your Kafka instance reliably where you need it. On-premise, in the cloud or in a hybrid setup. It's your choice.

Make your business a real-time business with Axual. Secure and compliant.

Eneco

Self-service topic management.

- Create and configure your topics in any environment through the graphical user interface
- Add metadata to your topics to help colleagues easily find the topic they need
- Test-drive your streaming applications in isolation, before moving them to production
- Axual supports the upload, view and download of schemas, to facilitate easy onboarding of producer and consumer applications.

Compliant. Secure. No worries.

- No Kafka topic is created before an owning team and metadata has been defined.
- Authorization approval workflows make sure produce/consume access to the topic is requested before the application is even capable of producing/consuming the data.
- Every single application must use SSL certificates in the connection to Apache Kafka
- Our streaming platform enables more fine-grained governance through environment-specific rules

Easy to deploy and maintain.

On-premise. In the cloud. Or a hybrid variant. It's your choice. Get up and running in days due to a standardized infrastructure, maintained as code. Deploy through the Axual CLI or Helm charts. When a new release of Apache Kafka comes out, our platform will upgrade seamlessly without any downtime. Yes, it's that easy.

No Kafka expertise required.

With Axual you don't need to be a Kafka expert to start streaming. Axual comes with built-in monitoring and alerting so you stay informed about important events. Axual also supports your current CI/CD setup, so you can automate Kafka operations from your development pipelines.
